The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or thugal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                       Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCCS polypeptide. The compound is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ABCC5; 88; antisense oligonucleotide; phosphorothioate linkage;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide compound that inhibits expression of ABCC5, usefu
for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense oligonucleotides which are targeted to, and inhibit the expression of, a nucleic acid molecule encoding nidogen. The antisense oligonucleotides are useful for treating a disease or condition associated with nidogen, such as Chediak-Higashi syndrome. They are also useful in research and diagnostics for modulating the expression of nidogen. The present sequence represents a human nidogen antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New compounds, particularly oligonucleotides targeted to a nucleic acid encoding nidogen, useful for treating diseases associated with nidogen, e.g. Chediak-Higashi syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               transplant rejection; immune system; rheumatoid arthritis; lupus;
inflammatory bowel disease; multiple sclerosis; HIV; AIDS; 88; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothiotete linkage, at least one modified sugar moiety, preferably a 2'-C-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human ABCC5 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence repersents an antisense oligonucleotide targeted to DNA encoding the human ABCC5 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                           Gaps

useful New oligonucleotide compound that inhibits expression of ABCC5, usefu for preparing a composition for treating hyperproliferative disorder, e.g., cancer.

Example 15; SEQ ID NO 129; 57pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human ABCC5 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloycosine. The antisense compounds are useful for modulating the expression of the human ABCC5 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence reperseents a human ABCC5 DNA antisense oligonucleotide target region of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound (e.g. an antisense oligonucleotide), having a sequence comprising 8-80 bp targeted to a nucleic acid encoding STAT 6 (signal transducer and activator of transcription 6, at transcription factor implicated in rheumatoid arthritis, obesity and allergy), specifically hybridises with the nucleic acid encoding STAT 6 appearing as ADP68397 and inhibits expression of STAT 6, Also included are a method of inhibiting the expression of STAT 6, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and a method of treating an animal having a disease or condition associated with STAT 6. The oligonucleotide compound is useful for preparing a composition for treating and disease, rheumatoid arthritis, allergy or obesity. The gene for STAT 6 is located on chromosome 12q13. The present sequence is a STAT 6 cDNA target sequence
                                                                                                                                                                                                                                                                                                                                                 Human; 88; antisense; STAT 6;

Also included are a method of inhibiting the expression of STAT 6, in cells or tissues, a method of screening for a modulator of STAT 6, in cells or tissues, a method of screening for a modulator of STAT 6, a diagnostic method for compound and a disease state, a kit or assay device comprising the compound and antitod of treating an animal having a disease or condition associated with STAT 6. The oligonucleotide compound is useful for preparing a composition for treating autoimmune disorder, rheumatoid arthritis, allergy or obesity. The gene for STAT 6 is located on chromosome 12043. The present sequence is an antisense oligonucleotide targeting STAT 6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER
/note= "Phosphorothioate backbone and all cytidines are 5
-methylcytidines"
                                                                                                                                                                                                                                                          Human; 88; antisense; STAT 6; signal transcription; transcription factor; rheumatoid arthritis; obesity; allergy; autoimmune disorder; chromosome 12q13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide compound that inhibits expression of STAT 6, useful for preparing a composition for treating e.g. autoimmune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                            This PCR primer was used together with AAQ26545 to amplify a 150bp stretch of DNA from the RING11 gene containing a polymorphism. Sequencing of the enrire RING11 sequence from EDNA clones from B 1 ymphoblastoid cell lines revealed a silent single base pair mutation, and 3 single base pair mutation, and 3 single base pair mutarion, and 3 single base pair mutaristed region. 2 of the coding sequence substitututions lead to amino acid substitutions, one of which changed the putative stop codon, and lengthened the protein by 17 amino acids. Caussoid controls were also analysed by oligonucleotide typing with probes AAQ26546-51
                                                                                                                                                                                                                       and diagnosis of immune disorders and screening of new immunosuppressants and immuno:enhancers.

The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HBR; HVV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-4448.                                                                                                                                                                                                                                                                              The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-4488. ```
encoding an immunoglobulin (Ig), heavy chain, variable region, framework region 1, which corresponds to residues 1-7 of the Ig sequence. The primer can be used in a novel method for the production of recombinant antibodies, comprising the selection of B cells from a lymphocyte fraction, isolation of mRNA from individual B cells, reverse transcription of the mRNA into cDNA, amplification of the cDNA by PCR and cloning and expression of the cDNA. The recombinant antibodies can be used for diagnosis and/or therapy, while the method avoids the need for intermediate separation of light and heavy chains and gene library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a PCR primer for IgG used in the present invention which describes a human monoclonal antibody (hMAb). The CDNA encoding the hMAb can be used for commercial production of the hMAb. The CDNA was isolated from an antitetanus toxin human monoclonal antibody producing hybridoma cell strain TTG6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New cDNA encoding human monoclonal antibody - useful for production of antibody by hybridoma techniques commercially.
                                                                                                                                                       The present sequence is a primer for the PCR amplification of the cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, monoclonal antibody; hybridoma cell strain TTG6; hWAb; IgG; antitetanus toxin; immunoglobulin G; PCR primer; ss.
                                                                   Prodn. of recombinant antibodies - by amplification, cloning and expression of cDNA generated from B-cell mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 0.4%; Score 15.8; DB 1; Length 21; Best Local Similarity 81.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        respectively) are designed to amplify exon 1 of the human hTSC gene (see AAV40561) that codes for thiazide-sensitive Na-Cl cotransporter TSC (see AAV40561). The forward primer lies within an intron of hTSC, while the reverse primer lies within exon 1. 27 Sets of specific primers (see AAV40565-V40618) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophoresis, and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome syndrome with provides products and methods useful for diagnosis and treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thiazide sensitive cotransporter and ATP sensitive potassium channel genes - useful for developing products for the diagnosis and treatment of ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.

New estrogen-receptor gene derived from bluegill animal encoding estrogen-receptor, useful for evaluating estrogen-receptor activity regulation ability of subject.
                                                                                                                                                                                                                                                                                                                The invention relates to a novel gene encoding an oestrogen-receptor protein. The invention may be useful for measuring the oestrogen-receptor activity regulation ability of a subject and is efficient in evaluating the oestrogen-receptor activity regulation ability of a chemical substance in an environment. The current sequence is that of the bluegill sunfish oestrogen-receptor-related PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises isolated human gene sequences and PCR primer sequences which can be used to detect single nucleotide polymorphisms (SNPs). The DNA sequences of the invention are useful for detecting SNPs existing in human genes and for the diagnosis of human disease. The present DNA sequence represents a human gene PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotide for detecting single nucleotide polymorphisms existing in human gene, contains isolated human gene having specified sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.4%; Score 15.8; DB 1; Length 21; 89.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of an antisense oligonucleotide that is targeted to an accessible region of P2X3 mRNA. P2X3 is a purinoreceptor that is implicated in pain sensitivity and bladder volume reflexes. The antisense oligonucleotide specifically hybridises within an accessible region of the P2X3 mRNA in its native state (see also ACC58776 and ACC58777), thereby reducing P2X3 production. Cells or tissues are contacted with the antisense oligonucleotide, resulting in an inhibition of pain sensory neurons, or an increase in bladder capacity. The method can be used to alleviate pain, e.g. in patients suffering from chronic pain, and to treat disorders of urine storage and voiding, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotide for inhibiting the production of the purinoreceptor P2X3 and for treating pain or disorders of urine storage and voiding, such as overactive bladder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                oestrogen receptor; regulation; environment; bluegill sunfish; ss; PCR;

The invention relates to a novel artificial animal cell expressing a variant androgen receptor. The variant androgen receptor is obtained by introducing a reporter gene, base sequence for initiating transcription, to the chromosome of the animal cell, where amino acid sequence of the variant androgen receptor is identical to that of a normal androgen receptor and has different amino acids at positions 646, 781 or 895 of a fully defined sequence of 918 amino acids as given in the specification. The artificial animal cell is useful for evaluating a substance capable of modulating the activity of the variant androgen receptor, which involves contacting a test substance with the animal cell, measuring the index value which has correlation and the expression value of the reporter gene or its quantity, and evaluating the ability of substance to modulate the variant androgen receptor based on the measured index value and the expression value of the reporter gene or its quantity. The method is useful for retrieving the substance which has the ability of modulating the variant androgen receptor. The variant androgen receptor regulator. The is useful for exercise in a substance that binds with the variant androgen receptor regulator. This

```

New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.

isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a PCR primer used in analysis of expression of a human NOVX polynucleotide of the invention. invention relates to human NOVX polypeptides and polynucleotides. The

```
The invention relates to an isolated human G-protein coupled receptor, HGPRBMY30 polypeptide or a sequence having 95% identity to the above mentioned sequences. (I) is useful for preventing or treating a medical condition, selected from an immune disorder; a cardiovascular disorder; an inflammatory disorder in which G-protein coupled receptors are either disorder; a neutral disorder; a med secondar; a metabolic disorder; a neutral disorder; an endocrine disorder; cesticular cancer; a neutral disorder; an endocrine disorder; cesticular cancer; an entangly sorders, and consider; as neutral disorder; (I) and (II) are also useful for detecting, prognosing, preventing, treating, and/or ameliorating the diseases such as hematopoietic and pulmonary disorders, Alzheimer's, Parkinson's diseases, diabetes, dwarfism, color blindness, retinal pigmentosa, as thema, expression, schizophrenia, sleeplessness, hypertension, anxiety, stress, renal failure, acute heart failure, hypotension, obesity, and extivity. (I) and (II) are useful for modulating signal transduction crivity. (I) and (II) are useful for modilating signal transduction activity. (I) and (II) are useful for modilating signal transduction crivity. (I) and (II) are useful for modilating signal transduction activity. (I) and (II) are useful for modilating signal transduction, size and shape, to change a mammal's mental state by physical state by influencing biorhythms, caricadic rhythms, copy planet, weight, hair color, eye color, skin, percentage of adipose tissue, pigmentation, size and shape, to change a mammal's mental state capabilities, hormonal or endocrine levels, appetite, librio, memory, erress, or or brist cognitive qualities. This sequence corresponds to a recent for pain the part of the rogalities. This sequence corresponds to a recent for pain the sequence corresponds to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·.

Measurement of nucleic acids, using a nucleic acid probe and analysis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe; polymorphism detection; mutation detection; disease diagnosis; microbial identification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence measuring a fluorescently labeled probe which produces The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target mucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symblotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to determine a Tm value. Methods of the invention allow target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Taq polymerase (so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex propers are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation coefficient than conventional graphs so more accurate quantitation is possible. The current sequence represents a synthetic deoxyribooligonucleotide that was used for investigating the base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining the concentration of a target nucleic acid, useful e.g. for

nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid

The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate

The present invention relates to an assay system for hepatitis C virus

(HCV) replicase activity. The assay system comprises an RNA template that
has an unstable, small stemloop at the 3' end capable of forming a copy-
back structure, a HCV non-structural protein 5B (NSSB), ATP, GTP, CTP,

and UTP nucleoside triphosphates (NTPS), where one of the NTP is
and UTP nucleoside triphosphates (NTPS), where one of the NTP is
and UTP nucleoside triphosphates to the identification of optimal
NSSB. The invention also relates to the identification of optimal
properties of an RNA template for copy-back self-priming RNA synthesis of
HCV. This activity can be used to screen for anti-HCV replicase compounds
to to characterise the biological relevance of lead compounds. The
CY NSSB polymerase mechanistically and kinetically and for designing
CY NSSB polymerase mechanistically and kinetically and for designing
System of the invention is useful for detecting HCV replicase activity.
The nucleic acid synthesised by NSSB is detected by evaluating an
utoradiograph of reaction products separated by gel electrophoresis. The
present sequence is RNA template, (AU)3 used to direct RNA synthesis by
CNA polymerase proteins of HCV, BVV and polivirus. This sequence is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Assay system for hepatitis C virus replicase activity comprises RNA template with unstable, small stemloop capable of forming copy-back structure, viral non-structural protein 5B, nucleoside triphosphates,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Fig 2A; 10pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zhong W, Hong Z, Lau JYN;

The present sequence is one of a number of oligonucleotides which were used for the generation of RNA-protein fusions, including fusions having a myc epitope tag. The RNA-protein fusions comprise a protein covalently linked to the 3' end of its own mRNA. This is accomplished by synthesis and in vitro or in situ translation of an mRNA molecule with a peptide acceptor attached to its 3' end. The RNA-protein fusions are incubated under high salt conditions to produce a protein library. This method is useful for improving or altering axisting proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may also be used to improve human or humanised single-chain antibodies for the treatment of a number of diseases. The method is useful for the isolation of proteins with specific binding properties, for screening complaining and claims ends on the basis of protein-protein interactions. Unlike prior art, the new method does not rely on manntaining the integrity of an mRNA-ribosome:nascent chain ternary complex, which is very fragile and is therefore of limited use. The method does not rely on topological links between the protein and the nucleic acid so that the information of the protein is retained and can be recovered in readable, nucleic acid form

```
Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor directed primer, comprising a sequence complementary to an adaptor segment. The present sequence is an example of a SSR primer, which is flanked amplified fragment encledtides. The method represents a modified amplified fragment encledtides. The method represents a modified amplified fragment length polymorphism assay, which is partic. useful for genome fingerprinting, i.e. for genetic trait marking and
                                                                                                                                                                                                                                                                                                                                                                                     Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and the selection of a specific protein or RNA, by in vitro or in situ translation of candidate RNA-protein fusions. These were used in translation of specific proteins to produce RNA-protein fusions, then selecting specific RNA protein fusions. The method is used to select proteins (or DNA encoding them) having altered properties, e.g. for identification of new binding reagents, to identify improved human antibodies or new enzymes. These proteins are potentially useful in diagnosis and therapy, or as industrial catalysts. The methods allow many rounds of selection and amplification to be performed, resulting in enrichment of even very rare molecules and allowing isolation of proteins that bind specifically to almost any compound or catalyse almost any

The method involves determining two alleles of the essential gene, testing potential allele specific inhibitors to determine whether the inhibitor is active on at least one but less than all of alleles. The inhibitors suppress either the synthesis or the biological activity of the target allelic gene product. The inhibitors are useful for treating or preventing cancer or other proliferative disorders in a patient. They are also useful for inhibiting growth of a cell by subjecting the cell to active on an allele of the conditionally essential and administering an inhibitor appecific inhibitors allows specific killing or reduction of growth of cancer cells. AAR80012-AAR80115 represent the sequences around
                                                                                                                              Identifying inhibitor active on conditionally essential gene (EG) subject to loss of heterozygosity in cancer, useful in cancer treatment, involves determining two alleles of EG and testing potential allele specific

                                                                                                                                                                                                                                                             PCR primers (AAQ72427-30) used for the mutagenesis of the tumour necrosis factor-alpha (TNF-a) (AAQ73431) to produce the mutein TNFa(D143N-A145R) (AAR62479). The resultant fragments were ligated into the expression plasmid pDS56/RBSII The expression of the wild type or mutein proteins is regulated by the lac repressor present on the plasmid pREP4. The gene encoding the protein is mutated at specific sites resulting in series of mutated proteins (AAR65493.103). The biological activities of TNF are mediated via specific receptor of mol. wt. 55 and 75 kDa called p55-TNF-R and p75-TNF-R respectively. The mutated proteins presented have a higher affinity for the human p75-TNF receptor than for the p55-TNF receptor. The mutated proteins can be used in a variety of therapeutic or diagnostic applications including cancer therapy, treatment of obseity, septic shock or bacterial meningitis. (Updated on
                                                                                                                                                                                                            New human TNF-a muteins with higher affinity for p75-TNFR - useful e.g. for cancer therapy, treatment of obesity and toxic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

When the probe hybridises to a target sequence so that the AE is centrally located, for example, when the target has the sequence in AAQ85329, the label (AE) is protected. In the example a target sequence in rabbit targeted oligo, Bg1830-F9, contains phosphorothicate linkages. Various phosphodiester and phosphorothicate oligos were synthesised and their AEQB5321 was used to measure hybridisation of an oligo. The phosphodiester and phosphorothicate oligos were synthesised and their with AE apps. All four phosphodiester-AE (PO-AE) probes hybridised well at 60 degrees. Bg1R38-PO and phosphorothicate oligos showed the highest extent of hybridisation (97/1% and 85.3% respectively) at 37 degrees. The remaining PO-AE probes showed an ave. of only 50% hybridisation, whereas the corresp. phosphorothicate-AE (PS-AE) probes averages 16.1% under these conditions. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                              Oligo:nucleotide screening assay method - to determine the ability of the oligo:nucleotide to form a hybrid with a target nucleic acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated mouse and human NF2 transcript isoforms - used to develop prods. for the diagnosis and treatment of neurofibromatosis type 2 diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                 (neurofibromatosis type 2) gene from various human tumours. NP2 is an autosomal, dominantly inherited disorder characterised by multiple tumours of the central nervous system, predominantly bilateral vestibular cumonsomal acoustic neuromas) of the sighth cranial nervo. Other schwannomas and presentle lens opacities. The NP2 gene, mapped to chromosomal region 22412 between the loci D2281 and D2228, acts a tumour suppressor. The NP2 gene is alternatively spliced resulting in three different isoforms encoding three different proteins, merlin isoforms I.

III, which are likely to have differing functions. Merlin stands for moesin-ezrin-radixin like protein, so called due to substantial homology with these three proteins. The NP2 gene isoforms and proteins encoded by the under suppressors and can be used to suppress tumour growth, as can the cDNA sequence in gene therapy applications. Antibodies raised against merlin proteins are useful as tumour targetting agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a PCR primer for DNA encoding the protein of the invention, which induces signal transduction of the vascular endothelial cell growth receptor KDR (kinase insert domain-containing receptor) by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KDR signal transduction inducer protein; human; diabetic retinopathy; vascular endothelial cell growth receptor; abnormal neovascularisation; kinase insert domain-containing receptor; solid tumour proliferation; gene therapy; metastasis; chronic rheumatoid arthritis; psoriasis; retinopathy; retinopathy of prematurity; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer for KDR signal transduction inducer protein coding sequence.
                                      are PCR primers used for the isolation of the NF2

The protein can be used in the investigation, diagnosis and treatment (including gene therapy) of diseases in which abnormal neovascularisation takes place, such as solid diseases in which abnormal covascularisation takes place, such as solid and retinopathy (including diabetic retinopathy and retinopathy of prematurity). It may be used as a screen for candidate KDR signal
binding to its intracellular domain. The protein can be used in the investigation, diagnosis and treatment (including gene therapy) of diseases in which abnormal neovascularisation takes place, such as solid tumour proliferation, metastasis, chronic rheumatoid arthritis, psoriasis and retinopathy (including diabetic retinopathy and retinopathy of prematurity). It may be used as a screen for candidate KDR signal transduction inhibitors for therapeutic use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                KDR signal transduction inducer protein; human; diabetic retinopathy; vascular endothelial cell growth receptor; abrormal necvascularisation; kinase insert domain-containing receptor; solid tumour proliferation; gene therapy; metastasis; chronic rheumatoid arthritis; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes neurofibromatosis type 2 (NF2) transcript isoforms. NF2 polynucleotides can be used for diagnosing NF2 diseases, for inhibiting growth of tumnours associated with NF2 mutations (including expression from cDNA introduced in gene therapy vectors) and to raise antibodies (useful as tumour targeting agents, since specific isoforms are often tumour-specific) and as immunoassay reagents for detecting NF2-expression products. NF2 is a tumour suppressor protein, and so has muticancer activity. The present sequence represents a PCR primer for mouse NF2, from an example of the present invention
                                                                                                                                                                                                                                                                                                                                                                  Proteins from neurofibromatosis type 2 transcript isoforms - used for diagnosis or inhibition of tumors, and generation of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

PCR primers AAH28492-93 were used to amplify cDNA encoding a human cancer associated antigen, which is a variant of the ING1 gene. The ING1 gene is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of a pathological condition in a subject such as cancer. The cancer associated antigen polypeptides are useful for

                                                                                                                                               This invention describes a novel method for specifically detecting microorganisms in a sample by Polymerase Chain Reaction (PCR) where in addition to reaction primers specific to the target organism, competition primers specific for non-target organisms are also used. The invention is used to detect microorganisms, particularly to detect infection by Listeria below the species level, especially Listeria monocytogenes. The invention allows detection of different subspecies of Listeria not provided by prior art. This sequence represents a PCR primer used in the amplification of the Listeria monocycogenes as per primer used in the pso protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; NOVX; human disease; NOVX-associated disorder; cancer; addiction; Hodgkin disease; Von Hippel-Lindau syndrome; Alzheimer's disease; stroke; tuberous seleroais; hypercalcaemia; Parkinson's disease; depression; tuberous seleroais; parcial palsy; epilepsy; Lesch-Nyhan syndrome; multiple sclerosis; ataxia-telangiectasia; leukodystrophy; anxiety; pain; obesity; Crohn's disease; osteoporosis; inflammatory bowel disease; inferdility; inflammatory bowel disease; scleroderma; haemophilia; diabetes; pancreatitis; autoimmune disease; scleroderma; haemophilia; diabetes; pancreatitis; autoimmune disease; bacterial infection; parasitic infection; graft-versus-host disease; ecell differentiation; cell proliferation; haematopolesis; wound healing; angiogenesis; PCR; primer; ss.

The present invention relates to a new polypeptide (NOVX). The NOVX polypeptide, nucleic acid and antibody are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX associated disorder. The NOVX nucleic acids, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as cancers, Hodgkin disease, Von Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous sclerosis, crebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-clangiectasis, leukodystrophies, addiction, anxiety, depression, pain, obesity, Crohn's disease, osteoporosis, inflammatory bowel disease, infertility, inflammatory bowel disease, atherosclerosis, hypertension, coleroforma, haemophilia, diabetes, pancreatitis, autoimmune disease, athem, arthritis, immunodeficiencies, Huving, viral, bacterial or parasitic infections, or graft-versus-host disease. The nucleic acids and consider that manual as targets for the identification of small
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   molecules that modulate or inhibit ergon neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and anglogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX subsetances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention for amplification of
                                                                                                                                                                                                                                                                                                                                                                                                                   New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. diabetes, multiple sclerosis, atherosclerosis, cancer, infections, osteoporosis or

New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and autoimmune diseases.

Example 3; Page 891; 977pp; English.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (TAREB1), C1 esterase inhibitor (CLNH), kallikrein taceptor B1 (TAREB1), C1 esterase inhibitor, (CLNH), kallikrein c1 (KLKI), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme (C 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one prayme coolymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more polymorphic positions in a gene cocding a protein selected from the group above; (3) constructing (M2) encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids (3) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopeptidase inhibitor using the polymorphic detai, (5) allibrary of nucleic acids each of which comprises one or more polymorphic positions within a gene encoding a nucleic acid sample, determining the numan protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, are useful for detecting, diagnosing, treating, there are useful for detecting, diagnosing, treating, involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's hypertrophy, vascular diseases, and/or atherosclerosis, and/or atherosclerosis, and companing arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease, arteriosclerosis, and/or atherosclerosi; inflammatory disease, contends of the contends of the contends of the contends of the contend

           polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition for treating mammary tumors associated with aberrant tyrosine kinase receptor activity in nonhuman animals, comprises one or more substances that inhibit the aberrant activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tumours associated with aberrant tyrosine kinase receptor activity in nonhuman animals. (C) comprises one or more substances that inhibit the aberrant tyrosine kinase receptor activity. (C) has cytostatic activity. (C) can be used as a tyrosine kinase receptor inhibitor, and an epidermal growth factor receptor (BGFR) inhibitor. (C) is especially useful for tracting canine mammary tumours. The present sequence represents a PCR primer for human HBR2 receptor, which is used in an example from the present invention for cloning the canine HBR2 receptor
                                                and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a composition (C) for treating mammary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bpidermal growth factor receptor; tyrosine kinase receptor inhibitor;
epidermal growth factor receptor inhibitor; EGFR; mammary tumour;
cytostatic; PCR primer; ss.

ABD32064 standard; DNA; 22

RESULT 1159 ABD32064/c

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitlenamatory steroid and ubiquinone. A composition of the invention has antiinflammatory steroid and ubiquinone. A composition of the invention immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

comprising oligomucleotides, a novel composition, all state active agent, comprising oligomucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and controlly depletion or hyposecretion, when administered to a mammal. The coligomucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a corresponding a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The cult and isease or conditions and/or surfactant hypoproduction are associated with a disease or conditions and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated continue maphysema, chronic obstructive pulmonary disease, pulmonary continues present in the target RNA serves to prevent the breakdown of the inflammation rejection, pulmonary infections, bronchities or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the inflammation and advanced the anti-sense oligos corresponding in the target RNA serves to prevent the breakdown of the particular and an an and an an and an an and an and an an and an and an an an an analysis and an analysis and an a

The present invention describes a method (M1) for estimating therapeutic efficacy of tumour necrosis factor (TNF). M1 involves evaluating the expression level of a TNF-related gene in a cancer cell. Also described is a kit for estimating the therapeutic efficacy of TNF, which is used in the treatment of cancers. The kit comprises a thermostable DNA polymerase and an oligonucleotide primer comprising a DNA sequence encoding a gene chosen from a protein kinase B (Akt-1) gene, death receptor (DR3) gene, multidrug resistance-associated protein (MRP5) gene, and multidrug resistance-associated protein (MRP5) gene, meather sequence represents a PCR primer which is used in an example from the present
e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

The present invention describes a method for promoting (MI) liver growth or promoting (M2) hepatocyte proliferation in the liver of a subject, cor promoting (M3) a pathological liver condition in a subject, or protecting (M4) liver from damage in the subject due to exposure to a hepatotoxic agent, which involves administering to the subject a vascular endothelial crowd in the factor receptor (VBGFR) modulating agent (I). Also described, (I) an article of manufacture comprising a container, composition comprisies of the composition for promoting liver growth, where the composition comprises of the composition comprisies a liver growth, where the composition comprises a vEGFR modulating agent in the amount effective to promote liver growth, a second container on the first container, and a composition comprises a VEGFR modulating agent in the amount cffective to promote liver growth, a second container comprising a buffer of the composition comprises a VEGFR modulating agent in the amount of the composition for using the kit for promoting liver growth, a second container and an instruction for using the kit for promoting liver growth. (I) has hepatotropic and antiliflammatory activities, and can be used for promoting liver growth promoter. (I) can be used for promoting crowth or hepatocyte proliferation in a subject such as liver creating a pathological liver form damage in a subject such as liver from damage in a subject come or hepatotoxic agent. The VEGFR modulator create a local cascade of signaling events originating in sinusoidal endothelial cells following to vEGFR receptor activation, which is much more potent and beneficial in promoting hepatocyte proliferation and liver growth than systemic containers sequence is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Promoting liver growth or promoting hepatocyte proliferation in liver of subject, treating pathological liver condition e.g. cirrhosis in subject, by administering vascular endothelial growth factor receptor modulator.
                                                                                                                                                    liver growth, hepatocyte proliferation, pathological liver condition, liver damage; vascular endothelial growth factor receptor modulator; VEGFR modulator; hepatitispion antiinflammatory; liver growth promoter; liver failure; hepatitis; liver cirrhosis; toxic liver damage; medicamentary liver damage; hepatic encephalopathy; hepatic coma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 22 BP; 6 A; 8 C; 3 G; 5 T; 0 U; 0 Other;

The method gene involves determining the amount of expression of an interferon-associated gene in cancer cells or virus-infected cells. The invention also relates to drug compositions for the treatment of cancer and viral diseases containing interferon-alpha together with a cycloxygenase-2 (Cox.2) inhibitor such as indomethacin which potentiates the apoptosis induction are useful in the treatment and prevention of cancers (e.g., cancer of the colon, lung, pancreas, breast, stomach, liver, kidney, nerve cell, skin, muscle, uterus and throat) and viral infections (e.g., hepatitis B and C). The present sequence represents a PCR primer used in real-time PCR to determine the amount of expression of an interferon-associated
                                                                                                                                                                                                                                        Interferon therapy, cancer, viral disease, viral infection, interferon-alpha; IFN-alpha; cyclooxygenase-2 inhibitor; Cox-2 inhibitor; apoptosis induction; colon cancer; lung cancer; pancreas cancer; presast cancer; promach cancer; liver cancer; kidney cancer; nerve cell cancer; skin cancer; muscle cancer; uterus cancer; throat cancer; hepatitis B; hepatitis C; cytostatic; virucide; cancer cell; interferon-associated gene; ERK1; real-time PCR; primer; ss.

                                                                                                                                                                                                                                                               The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5-end and 3'-end of nucleic acid target comprising gene (s) chosen from e.g. interleukin (IL) - 4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating sespiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy (les), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CODD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchies, airway.
                                                   e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              יאמטאי, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant gener CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g., asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present invention relates to an oligonuclectide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL) 4 receptor, IL-5 receptor or salts of the oligonuclectide and optionally surfactant operatively linked to the oligonuclectide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonuclectide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. The respiratory or lung disease. CC chosen from airway inflammation, allergy(iss), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (CRDD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway contaction. The present sequence represents an oligonucleotide of the
                                                                                                                     airway inflammation; allergy; asthma; impeded respiration; cystic fibrosis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        initiation codons and introns of respiratory disease-relevant gener
CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
disease e.g., asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel single or multiple target oligonucleotide anti-sense to
                                                                                                 interleukin; IL-4 receptor; IL-5 receptor; lung disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nyce JW, Tang L, Sandrasagra A, Aguilar D, Miller S; Shahabuddin S, Lu H, Cong H;

Shahabuddin S, Lu H, WPI; 2004-293804/27. Novel single or multiple target oligonuclectide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.

Claim 2; SEQ ID NO 1772; 174pp; English.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Edtakin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Edtakin PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(S) or expressed product(S), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a conjunct ociding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Edtakin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for reating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A inflammation or an inflammation, allergies associated with inflammation or an inflammation, allergy, asthma, impeded respiration, cystific fibrosis (CP), chronic disease. The respiratory or lung disease is associated with impeded respiration, cystific fibrosis (CP), chronic obstructive pulmonary disease. allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the invention

The present invention relates to a method of providing neuroprotection in a subject, which comprises administering to the subject a ciliary curvothic factor (CMTP) peptide or its biologically-active fragment or variant and a peptide that acts as a receptor for active fragment or variant and a peptide that acts as a receptor for CMTP. The method, composition and compound are useful in providing neuroprotection in a subject. The peptide having the activity of a CMTP peptide and the peptide that acts as a receptor for CMTP are useful in providing neuroprotection. For modulating cell degeneration or cell death, for treating or preventing a medicament for neuroprotection, for modulating cell compound. The method, composition and compound are useful in treating or preventing a subject with substance abuse, trauma, stroke, ischaemia, Huntington's disease, Alzheimer's disease, Parkinson's disease, prion disease, variant Creutzfeld-dakeb disease, amyotrophic lateral scleresis

```

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 mucleotides of the 5'-end or 3'-end of a mucleic acid target consen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are treptratory or lung disease. The respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          interaction between a target sequence, especially a nucleic acid, and a probe on an array, in which adapter molecules are fixed to the target, forming a continuous sequence. Labelling of the target is independently mediated by interaction of the adapter molecule with a label. The method is used to investigate the genotypic and physiological status of cells, e.g. to detect chromosomal resistence genes in Staphylococus aureus. The method provides a modular, specific and sensitive system for quantitative homogeneous and parallel labelling of a target, before, during or after interaction with the probe array, and both DNA and RNA can be labeled. The detection signal may be amplified and only low concentrations of
encelopathy. The present sequence is a PCR primer used to isolate a Cx43 coding sequence in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        label (particularly 0.1-1 micro M) are used, so non-specific signals are minimised. This sequence represents a polyA adapter used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Probe; detection; genotyping; cell status; chromosomal resistance gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting specific interactions between molecular targets and probes, useful for determining genotypic and physiological status of cells, by attaching an markable adapter to the target.
                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for detecting the specific

                                                                                                                                                                                                                                                                                                           The oligomer comprises an 18-mer regional oligonucleotide corrresponding to the anti-codon region of the reverse transcriptase (RT) primer tRNA_Lys, with a S' terminal thiolated 22-mer homooligomer. The homooligomer may be absent and the regional oligo may itself be thiolated (e.g. 5-Mercapto-), as in Claim 19. The oligos are used to inhibit reverse transcription in the treatment of HIV.                                     This sequence represents a primer used in the isolation of cDNA fragments of the PTAM (testis specific protein expressed in prostate cancer) gene. PTAM is expressed in 1 isoforms PTAM-1, 2, and 3. The PTAM gene is located on chromosome 1922. PTAM is overexpressed in prostate cancer, and has a testis specific expression pattern in adult tissues. PTAM shows no homology to any known gene. PTAM can be used in methods for the diagnosis of cancer, especially prostate or breast cancer, where the normal tissue samples are prostate tissue, or breast tissue, bone tissue, lymphatic tissue, a vaccine composition targeting PTAM, PTAM, ribozymes specific for PTAM and antisense sequences, can be used to treat cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               can

                                                                                                                                                                       New compositions having the 202P5A5 gene and encoded protein, useful for diagnosing, preventing, prognosticating or treating cancer of the prostate, bladder, colon, lung, ovary, breast, stomach, cervix, lymphoma,
                                                                                                                                                                                                                                                                          The invention relates to a composition comprising 202P5A5 proteins. The composition and proteins are useful for detecting and treating cancer by inhibiting the growth or viability of cancer cells. The present sequence represents the human 202P5A5 cDNA synthesis primer.

The invention relates to a method of determining the presence or absence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid. Determining the presence or absence of a CYP2D6 target sequence in a sample of DNA containing CYP2D6 nucleic acid comprises contacting the nucleic acid with a probe under stringent binding conditions, and detecting the presence or absence of the target sequence bound with the probe with a scattered light detectable particle, by observing light scattered from the particle which indicates the presence of the target sequence. The method is useful for determining the presence of absence of particular single nucleotide polymorphisms or alleles in genomic nucleic acid, especially in a pharmacogenetically relevant gene or genes in a DNA sample, and to detect and measure one or more target sequences in a sample, the method may also be used to detect specific mutations to identify the phenotypic classification of an individual. ABX30162-
modulate the status of 125P5C8 (125P5C8 is a novel cancer-associated gene/protein), or a molecule that is modulated by 125P5C8. The composition of the invention is useful for diagnosing or treating cancer. The present DNA sequence represents a cDNA synthesis primer that was used in an example of the invention to isolate a fragment of the 125P5C8 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining the presence of a CYP2D6 target sequence in a DNA sample containing CYP2D6 nucleic acid, for detecting mutations or polymorphisms, comprises detecting the scattered light from a particle bound to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; CYP2D6; primer; single nucleotide polymorphism detection; SNP; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a segment of the hepatoma AS-30D Type II blackhinase promoter region. Response elements (transcription factor binding site) in this fragment may consist of all or part of the present sequence. AS-30D is a new isolated hexokinase II. The present The present reading frame and contains at least one response element. The present DNA fragment may be coupled to a reporter gene and used to screen for potential drugs that affect regulated transcription of tumour hexokinase II. Alternatively it may be coupled to a toxic gene and used to treat cells that over-express hexokinase II, such as those present in patients with cancer. It may also be used in gene therapy to treat diabetes. The heterologous protein. Probes of the DNA fragment are used in the method for diagnosing a neoplasia that over-expresses hexokinase. The new for diagnosing a neoplasia that over-expresses hexokinase. The new

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7575 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                           stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.4%; Score 15.4; DB 1; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75722 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                       Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;

Synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient prefetors of vascular endothelial growth factor (VEGF). A patient receptors of vascular having a condition associated with the level of the fims-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                      present invention describes nucleic acid molecules which modulate the
                                                                                                                                                                                        Nucleic acid molecule modulating VEGF receptor(s) gene expression or stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 6 A; 3 C; 5 G; 0 T; 3 U; 0 Other;

Treating type II diabetes involving hepatic nuclear factor 4 - useful, e.g. to treat insufficient HNF expression or bioactivity, overexpression of HNF or expression of mutant HNF gene in diabetic patients.

Disclosure, Page 86, 116pp, English

```
This is the nucleotide sequence of the PCR primer used for amplification in the method of invention, involving the treatment of type II diabetes with hepatic nuclear factor 4 (HNF-4). The agonists of normal HNF bioactivity can be used to treat diabetes, e.g. to ameliorate disease symptoms involving insufficient expression of an HNF gene and/or inadequate functional HNF bioactivity can be used to treat diabetes, e.g. to ameliorate disease symptoms involving expression of a mutant HNF gene or overexpression of a normal HNF gene. It is also useful to ameliorate disease symptoms involving expression of a mutant HNF gene or overexpression of a normal HNF gene. It is also useful to ameliorate disease symptoms involving a mutant (non-functional) HNF protein e.g. by administering a therapeutically effective amount of an anti-HNF antibody. Protein that binds to the mutant HNF-4 protein is useful in screening assays, e.g. to identify antagonists/agonists of an interaction between a CNF protein and a binding protein to develop drugs for disease treatment. Diabetes mellitus is a common metabolic disorder, and most cases are type of inconinguin dependent diabetes mellitus (NIDDM). A major genetic component is implicated, but few genes have been identified. Mature onset diabetes of the young (MODY) loci have been identified. HNF-4 is encoded by a gene mapping within the MODY1 locus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of the PCR primer used for amplification in the method of the invention, which involves modulating the expression of hepatic nuclear factor or other diabetes related gene. The method is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARWT) gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 gene, an integrin subunit beta 3 corresponding target esquences; and AAA1765 to AAA1767 and AAA17650 and AAA1762 represent ribozyme sequences for ARNT, and AAA1168 to AAA17660 and AAA17685 to AAA18386 to AAA19086 corresponding target sequences; AAA17685 to AAA18386 to AAA19086 and AAA19155 to AAA21922 represent their corresponding target sequences; AAA19155 to AAA21801 and AAA21801 to AAA21805 represent ribozyme sequences; AAA1895 to AAA2160 and AAA21696 to AAA21688 represent their corresponding target sequences; AAA21696 to AAA2168 represent their corresponding target sequences; AAA21699 to AAA22475 and AAA23283 to AAA23362 to AAA21500 and AAA23489 to AAA22435 and AAA23283 to AAA23362, AAA23302, AAA2343 to integrin subunit beta 3, and AAA2346 to AAA2343 the invention are used for modulating the synthesis, expression and/or
                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vel ribozymes for modulating the synthesis, expression and/or stability an mRNA encoding an angiogenic factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiniflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; veruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; ss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             homology to risks kinase. Special produced by transgenic creatures the containing (1) are useful for production of offspring. T66Bk, its containing (1) are useful for production of offspring. T66Bk, its etc., are useful for the isolation of receptors on the surface of sperm recognising attractants of the egg cell for the development and/or production of contraceptives. They can also be used to identify chemicals or biological compounds able to trigger the (premature) activation or inhibition of the Responder/Distorter signalling cascade, or to identify and isolate receptors and other members of the cascade that bind the transgenic animal, and selecting dained (1) also provide a means for distorting the transgenic ratio of genetic traits by altering genes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a PCR primer used in the cloning of the T66Bk gene. The invention related to a nucleic acid molecule (I) comprising a transcription unit encoding in its 5' portion a kinase having a homology to MARK2 kinase and the 3' portion of the nucleotide sequence has a high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Transcription unit; MARK2 kinase; rsk3 kinase; regulatory region; T66Bk;

           also allow distortion, to a non-Mendelian ratio, of the transmission of genetic trait, i.e. determination of sex, from male mammals to their offspring by expressing during spermatogenesis/spermiogenesis a gene involved in sperm motility and/or fertilisation. The genes and proteins involved in the responder phenotype and Responder/Distorter signalling cascade, as well as the inventive methods are advantageous in breeding strategies by allowing for specific selection of genetic traits and in particular, of sex
Responder/Distorter signal cascade other than the t-Responder. They

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human c-erb-B-2 (HER-2) gene. The probes are used to demonstrate the method of the invention. The specification describes a method for the method of the invention. The specification describes a method for the detection of chromosome aberrations in eukaryotic samples uses sets of peptide nucleic acid (PNA) probes in hybridisation reactions. The method comprises using at least 2 sets of hybridisation probes, where at least comprises one or more PNA probes capable of hybridisation to chromosome. The methods can be used for the detection of chromosome chromosome. The methods can be used for the diagnosis of disorders and diseases related to chromosomal aberrations or abnormalities such as e.g. cheated to chromosomal aberrations or abnormalities such as e.g. chempositic malignancies, cancers and inborn constituel diseases. The method may be used for detecting viral sequences and their localization in the chromosome. In plant biology, the methods can be used for monitoring the efficiency of transferring herbicide resistance genes to a

The invention relates to detecting (MI) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased expression of the gene. The method is used for detecting polymorphisms in useful for screening individuals for variation in glucuronidation activity, for optimising drug dosages for a patient, where the drugs (GG. Irinotecan or TAS-10) are glucuronidated by UGT (preferably UGTIA1) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an
and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the MGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ds; UGT1A1; promoter; Gilbert's syndrome; hyperbilirubinaemia;

contained in the DNA and determining the number of TA repeats in the promoter. Contained in the DNA and determining the number of TA repeats in the promoter. Thus the DNA being amplified comprises all or part of UGTIAI promoter. The DNA is amplified by a polymerase chain reaction and sequencing the amplified DNA. The polymorphism comprises an allele consisting of five TA repeats (TA) s. six TA repeats (TA) s. or seven TA repeats (TA) s. (TA) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, comprises determining the presence of five thymidine-adenine repeats in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to detecting (MI) polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter by determining the presence of five thymidine-adenine (TA) repeats in the promoter, where the presence of the five TA repeats correlates with increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, ds, UGT1A1, promoter, Gilbert's syndrome, hyperbilirubinaemia, uridine diphosphate glucuronosyltransferase, Crigler-Najjar syndrome, UGT, polymorphism detection, TA repeat, glucuronidation, Irinotecan;

cosperssion of the gene. The method is used for detecting polymorphisms in a UGT gene promoter, preferably a UGT I (UGTIAI) gene promoter. (MI) is a UGT gene promoter, preferably a UGT I (UGTIAI) gene promoter. (MI) is activity, for optimising dosages for a patient, where the drugs cativity, for optimising dosages for a patient, where the drugs (e.g. Irinotecan or TAS-103) are glucuronidated by UGT (preferably UGTIAI) and the activity of the drug is effected by its level of glucurodination. The method preferably involves obtaining DNA from an individual, amplifying all or part of a UGT gene promoter (UGTIAI) gene promoter. Thus the DNA being amplified comprises all or part of the promoter. The DNA is amplified comprises all or part of the number of TA repeats is determined by gel electrophoresis or by UGTIAI promoter. The DNA is amplified by gel electrophoresis or by the number of TA repeats is determined by gel electrophoresis or by CC generaling of five TA repeats (TA) 5, six TA repeats (TA) 6, or seven TA repeats (TA) 7. The promoter has any one of the genotypes (TA) 5/(TA) 8. (TA) 7/(TA) 8. (TA)

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

Example 6; Page 2; 13pp; English

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGT1A1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter — as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual's sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism \$\$666666666668\$\$

Detecting polymorphisms in uridine diphosphate glucuronosyltransferase gene promoter, useful for optimizing drug dosages for a patient, involves determining number of thymidine-adenine repeats in the promoter.

Example 6; Page 2; 13pp; English.

The invention comprises a method for detecting polymorphisms in a uridine diphosphate glucuronosyltransferase (UGT) gene promoter (preferably UGTLA1). The method involves determining the number of thymidine-adenine (TA) repeats in the promoter - as the number of TA repeats correlates with expression of the UGT gene. The method of the invention is useful for detecting polymorphisms in a UGT gene promoter. The method of the invention is also useful in optimising drug dosages and predicting an individual sensitivity to xenobiotics for drugs and xenobiotics that are glucuronidated by UGT. The present DNA sequence represents a UGT gene TA repeat polymorphism

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence of 6711, (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner (I) and nucleic acids (II) for identifying a specific binding partner (I) and nucleic acids (II) caused by altered expression of human POSHL1 including diagnosing and treating caused by altered expression of human POSHL1 including diagnosing and treating caused by altered expression of numan POSHL1 including diagnosing and treating caused by altered expression of human post in general partner of vaccines and (II) is treating caused by altered expression of producing the proteins. The transgenic non-human animals capable of producing the proteins. The present sequence did not form part of the privanted specification, but is based on sequence information supplied to berwent by the European Patent Office

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, liver failure, hepatocaliular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleocides and a 3 and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

```
The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WWV). The nucleic acid molecules are useful for treating a condition related to WWV infection e.g. pancreatitis, encephalitis, waycarditis, meningitis, neurologic infection, hepatitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least the 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleotides and a 3' and modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 47502-17514 are not given molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                 virucide, neuroprotective, antibacterial, replication, pancreatitis, encephalitis, myocarditis, meningitis; infection, hepatitis, liver failure, cancer, cirrhosis, Hammerhead, Inozyme, DNAzyme,

and transfected cells.

```
The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that thybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, dentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the nucleic acids, cells containing the cvector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell cegases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in disease whe nother samples is useful for diagnosis and/or prognasis of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .;

in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of planamecuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence data for this patent did not form part of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel isolated nucleic acid sequences involved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS; Rep-X; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome; Fredreich's ataxis; myotonic dystrophy; hyperandrogenaemia; spinal atrophy; bulbar atrophy; spinocerebellar ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule are useful for reducing HER2, K-Ras H-Ras, and HIV) or a component of HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian colorectal, lung, prostate, albadder, or pancreatic cancer, and HIV infection, and ALDS. The sequences shown in ABZ56899 - ABZ62216, ABZ64544 - ABZ65531, ABZ65210 - ABZ65524, ABZ65531, ABZ655
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tumour suppression; tumour reversion; apoptosis; virus resistance; cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human tumour suppression/reversion-related DNA sequence SeqID4181.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, BST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, FOMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                              diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's araxis, myotonic dystrophy, hyperandrogenemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Simple sequence repeat, plant, ds, SSR, ryegrass, fescue, tandem repeat, cereal profiling, grass profiling; seed batch purity testing.
                                                                                                                                                          Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for

The invention relates to a substantially purified or isolated nucleic acid (I) from ryegrass or fescue species including a simple sequence crepeat (SSR), having 2 or more tandemly repeated nucleotide core elements C2 -6 nucleotides in length. Also included are a nucleic acid primer can table for amplifying an SSR, identifying (MI) an SSR by preparing a library of ryegrass or fescue genomic DNA enriched for SSRs and identifying clones in the library containing SSRs, a library of ryegrass or fescue genomic DNA enriched for SSRs prepared by the MI, selecting for a gene in grass or cereal breeding by identifying an SSR that is closely a sesociated with the gene such that the SSR and the gene are core associated with the gene such that the SSR and the gene are preferentially co-inherited, and selecting for the SSR in the breeding, a method for DNA profiling grass or cereal species varieties by assessing variation within seed batch of an SSR. The SSRs can be used in the selection of genes in grass or cereal breeding, for profiling grass or cereal species varieties, for testing the purity of grass or cereal seed batches, and for DNA profiling to establish the calesing the grass or cereal seed batches, and for DNA profiling to establish the calesing the grass or cereal seed batches, and for DNA profiling to establish the sequence is a ryegrass or fescue SSR
                                                                                New simple sequence repeats having 2 or more tandemly repeated nucleotide core elements isolated from ryegrass and fescue, useful for selecting of genes in grass or cereal breeding or profiling grass or cereal species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of treating osteoarthritis via the administration of a composition comprising the camptodactyly-arthropathycoxy vara-pericarditis (ACPC) protein, or portions of the GACP protein.

The composition may further comprise a local anaesthetic. The composition of the invention may be administered via intra-articular or intravenous injection. The human CACP protein is identified in the invention as being megakaryocyte stimulating factor (MSP). The gene encoding CACP protein (MSP) is located on chromosome 1q25-31, and mutations in this gene are responsible for the heritable disorder camptodactyly- arthropathy-coxa vara-pericarditis, in which patients have synovial hyperplasia without evidence of inflammation. CACP protein (MSP) acts as a synovium lubricant, and can be used to lubricate tissue and joints in the treatment of osteoarthritis in the composition may be applied to reduce the cymptoms of osteoarthritis (e.g., joint pain, loss of range of movement or joint damage). Sequences AAF59672-AAF59693 represent PCR primers used
                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                             The present invention relates to a new technique of polymerase chain reaction-single strand conformation polymorphism (PCR-SSCP) to identify accurately Korean beef cattle in a short time by removing processes which requires expensive restriction enzymes. The present sequence is a PCR primer for bovine melanocortin receptor (BDF3) which was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, CACP protein, camptodactyly-arthropathy-coxa vara-pericarditis, MSF; megakaryocyte stimulating factor; synovial lubricant; chromosome 1q25-31; osteoarthritis; joint lubrication; osteopathic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases graft versus host diseases, degenerative nervous system diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, arcophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease, where the sclerosis and Alzheimer's disease, with allergens that lead to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

proluding autoimmune disease, degenerative nervous system diseases, graft versus host disease, hypersensitivity diseases, infectious diseases and neoplastic diseases. Autoimmune diseases include Addison's disease, attrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type allergies, Type II hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those manifested in leprosy. Infectious diseases include viral infections caused by whithes such as HIV, fungal infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic infections such as those caused by Mycobacterium, Neoplastic diseases include lymphoproliferative diseases
                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 18 claims primers for use in detecting mutations in a mammalian gene for a structural protein of cartilage comprising a sequence identified in Table I (Page 18-31). Table I includes 179 primer sequences (see AAQ65728-Q65906). The following details are given for primer 103: Region/exon: 13 Direction: sense Primer position: 2165 (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           diseases
